# Pigmented Full Grain Leather

Plot No. 653 Tarbagiya, Tiwaripur Road, Near Takwa Masjid, Jajmau, Kanpur-208010 (U.P.) India  
+91-9450479936, +91-7905623298

# Suede Leather

Suede is a kind of leather fabric. It can be derived from any animal skin that is used in the production of normal leather. The prime difference between suede leather and normal leather is that suede is made from the underside of the animal skin while normal leather is made from the topside of the animal skin. Because of this underskin composition, suede leather has a soft surface.

Suede is usually made from lambskin but is also made from the skins of goats, pigs, calves and deer. In order to make suede fabric, the underside of the animal skin is separated from the top which makes suede leather thinner and flowy. It is therefore a split leather as compared to full grain leather. Because of this suede is less resistant to stains and durability. Suede leather is generally treated as a luxury fabric. This type of leather fabric has a napped finish. The nap of the fabric has tiny raised hair and can be tougher if the hide is used from older animals or animals with tougher skins like cows and deer.

# Nubuck Leather

Nubuck has a feel similar to suede but it's more durable since it comes from the top grain of the hide. It has a great look and feel and is used for a wide variety of products. It brings together some of the finer qualities among the various kinds of leather.

To make nubuck leather, the outer (top-grain) layer of calfskin or cowhide is used. The top-grain layer is tougher and more resilient than the inner layer, which is used to make suede. However, because it may have visible markings and defects, the top grain is sanded and buffed on the outside to provide a consistent appearance. The sanding process leaves a slight nap of short protein fibers, giving a velvet-like finish to the leather. In order to hide any defects remaining in the nubuck surface, it is stained or dyed. How to wear leather apparel

Because nubuck is made from top-grain leather, it is more durable and tough compared to suede. It is also more durable than bicast leather or bonded leather, which do not use the top-grain portion of the hide. However, it is more vulnerable to soiling and staining than other leathers due to its rough surface.
